

Disclaimer: The existing agricultural drain tile locations depicted on this map have been identified and mapped based primarily on the interpretation of historical aerial imagery and other available historical information. The locations, alignments, sizes, depths, connections, outlets, and overall condition of existing drain tile systems have not been field-verified unless specifically noted otherwise.

Historical aerial imagery may indicate the presence or general alignment of subsurface drainage through visible crop patterns, soil moisture patterns, vegetation differences, surface features, or other indicators; however, such indicators are subject to interpretation and may not accurately represent the actual location or configuration of the underlying drainage system.

Accordingly, the mapped drain tile locations should be considered approximate and for planning and informational purposes only. The mapping should not be relied upon as a survey, as-built record, engineering design, or definitive representation of existing subsurface drainage infrastructure.
